*Allowable Subject Matter*

Claims 1-15 are allowed.

The prior art does not teach or would not have rendered the claimed invention obvious. While the prior art of record teaches detecting a changed in network topology and subsequently detecting a loop. It fails to support a method of loop detection and dissolution in a communications network, as claimed, having means for:

- sending a vote token from a detecting node to each neighbor node;
- receiving the vote token from the sending node at each of the neighbor nodes;
- forwarding the received vote token to all neighbor nodes, if the receiving node has the same or less neighbor nodes than the sending node; and
- sending a new vote token to all neighbor nodes if the receiving node has more neighbor than the sending node.

and:

- sending a vote token to all fully qualified neighbors of a node detecting a change in topology or external event;
- forwarding the received vote if the receiving node has the same or less fully qualified neighbors;
- sending a new vote token if the receiving node has more fully qualified neighbors; and
- detecting a loop once a vote token has returned back to the originating node.
